

## Engineering Process

### Customer vs Application vs Ops

### Base Estate vs Fully Managed

"Virtual Appliances, Cloud Native Apps, COTS, domain joined"

### Customer Requirements

- RDP, SSH, SPN, MI, GitLab, TF Workspace

### Azure IAM

- Group Memberships
- AD Groups / Memberships

### Documentation

- HLD / LLD
- GitLab Repo / As-Built in Markdown
- Run-books, SOPs
- Operating Manuals

### Fully Managed

TTO > Minimum Supportable Version, CMDB

Access > Remove Access after onboarding.

Non-Immutable Comment the VM Block and update the rest.

Friday 8 April 2022, 9:33 AM AEST  
Participants: Arunesh Arunesh [A], Nicholas Baechter [N], Sean Cole [S], Phil Heath [P], Wayne Thompson [W], Todd Warren [T], Adam Alcorn [A], Mathew Kishman [M], Denny Selvy [S], Ramesh Khanna [R], Anish Kumar [K], Long Wang [W], Peter Oliver [O]  
(edited from P)  
[A] asked through request mapping of process.  
[A] went through input requirements for each SR table.  
[P] asked to find out the information requests to avoid having to go back to project teams and application owners to prevent rework and delays.  
[W] question on whether a separate meeting request needs to be included. [A] it's a part of other processes.  
[S] went to confirm the target end state in the landscape in final without customer needing to touch anything. [M] yes for fully managed. [S] when they see all the transform scripts for base estate they'll request fully managed.  
[P] requires input from the customer because we are handing it back to them. Do we need to include things that required by customers to fully managed.  
[S] yes in the customer. [P] can be project team or application owner customers. [S] also it's being handed back to [P] depends on fully managed is base estate and whether it is just approved to proceed that are required by project teams. Do customers understand what is actually meant by fully managed. Need to make such guidance is clear.  
[A] went through high level engineering process.  
No questions raised on SRs for engineering.  
[A] went through blueprint customisation and implementation process.  
[W] when customising blueprints are we including updating other blueprints or it's just customer specific?  
[S] have removed operational requirements that suggested any latest version in order to TTD.  
[W] need you customer's blueprint it's no longer a blueprint but a deviation.  
[A] need an example of why blueprint needs to be customised by client?  
[M] yes in the feedback given about additions that have been done for change accounts and other additions.  
[S] include coding, quantity, etc as the main customisations. In order to do that at the moment it means changing the code base - return it to only change config types rather than changing code.  
[M] need to build a solution of what is required by customer.  
[S] have to trust the build team in terms of what needs to be customised.  
[A] question about use of custom images. [A] more geared to appliance and COTS that can't use SR.  
[M] need to know what the build team capabilities in the use of those would require and non-standard images.  
[A] moved on to migration.  
[P] information of the base SR schema and structure prior to data migration being done? [A] SR team does the config. [P] SR team have their own process for backup and migration of data. [M] diagram shows implementing an option for backup and restore, not actually doing it.  
[A] we're managing certified SRs only.  
[W] while delivery mode of databases and SRs team is set but needs to be worked on as RDC team to their own thing.  
[P] do we have a clear view of what is actually being in the images?  
[S] we have SRs templates, start from security requirements because Cyber haven't provided them.  
[A] what is included within code management? Either should be build in and immutable or done as post-deployment scripted activity.  
[P] only limited to.  
[S] not starting as infra deploy - app imaging and deployment is another conversation.  
[S] how do app owners install without contributor access?  
[S] they try to do it in the SR or SR for SRs.  
[W] need to know what permissions they should have given to them during deployment.  
[S] out of time but to be discussed next week.  
[A] finished off last stage that, SRs, and mapping to TTD.  
[W] and [S] discussion on what is actually approved for documentation standards - needs to be reviewed later.  
[S] requiring this needs to be worked out as well from marketplace to better TTD.  
[M] potential hardware can be different from run-time to prod.

Phil's Notes  
Wayne:  
The privacy you close a blueprint, it's no longer a blueprint.  
Ramesh:  
Why do we need to customise a blueprint?  
Denny:  
It's good to allow some customisation of blueprints.  
Ramesh:  
Question around database landscape - what's included in the images in the image gallery?  
Do we have a clear view of what is being built into the images?  
Adam: I see blueprint customisation as a feature and not a bug/issue. It provides flexibility to the customers.
